

ÉLEVÉ BY CHANDNI

Website Handover & Maintenance Guide

WEBSITE

elevebychandni.com

VERSION

1.0.0

HANDOVER DATE

12 August 2026

PREPARED BY

EMITZ Studio

01

Project Overview

Purpose, journey & production details

Élevé by Chandni is a premium single-page marketing website for a personal styling and image advisory brand. It introduces the founder, presents service packages, and drives visitors to book a discovery call.

PRODUCTION URL www.elevebychandni.com	REPOSITORY github.com/elevebychandni-ctrl/-lev-by-Chandni
HOSTING Vercel · Project: lev-by-chandni	BRANCH main → auto-deploy to production

Primary User Journey

Land on hero → explore belief, services & outcomes → read about Chandni → view testimonials → scroll to booking → schedule via Cal.com. WhatsApp available throughout.

Pages & Sections

ROUTE	CONTENT
/	Full site: Hero, Belief, Services, Method, Outcomes, About, Testimonials, Booking
/terms	Terms & Conditions (lazy-loaded)
/eLeve	Redirects to /

02

Technology Stack

Framework, tooling & key libraries

FRAMEWORK

React 19 + TypeScript 5.9

BUILD TOOL

Vite 8

STYLING

Tailwind CSS 3.4

TECHNOLOGY**ROLE**

react-router-dom

Client-side routing (/, /terms)

framer-motion

Scroll reveals, hero motion, line animations

lenis

Smooth scrolling

@calcom/embed-react

Inline booking calendar

Radix UI + shadcn/ui

Accessible UI primitives (components/ui/)

vitest + playwright

Unit & browser tests

Note: No runtime environment variables are used. The app has no `.env` dependencies — all config is in code or `index.html`.

03

Architecture & Structure

How the application is organised

```

index.html → main.tsx → App.tsx (Router + MotionConfig) | — / → ElevePage (all sections) | | —
EleveHeader, EleveHero, EleveMarquee, ElevePhilosophy | | — ElevePersonalBrand, EleveServices,
EleveMethod, EleveOutcomes | | — EleveOtherServices, EleveFounder, EleveTestimonials | | —
EleveBooking → EleveCalInline | | — EleveFooter, EleveWhatsApp | — /terms → EleveTermsPage (lazy)
| — components/site/motion.tsx (shared animation system) lib/content.ts (photos + contact) •
copy.ts (all copy)

```

Key Directories

```

web/
|— src/pages/eleve/      ← Page sections + copy.ts + tokens.ts
|— src/components/site/ ← Motion system (motion.tsx)
|— src/components/ui/   ← shadcn/Radix primitives
|— src/lib/content.ts   ← Photos + contact constants
|— public/images/       ← Photography (AVIF/WebP/JPG)
|— public/fonts/        ← Self-hosted Libre Baskerville + Inter
|— index.html           ← Meta, JSON-LD, GA snippet, font preload
|— vite.config.ts       ← Build config (@ alias → src/)
|— package.json         ← Scripts & dependencies

vercel.json             ← Root deploy config (builds web/ subdirectory)

```

05

Content & Assets

Where to edit copy, images & data

TO CHANGE...

EDIT THIS FILE

All website copy (services, testimonials, method, outcomes)	<code>web/src/pages/eleve/copy.ts</code>
Navigation links, social links, legal links	<code>web/src/pages/eleve/tokens.ts</code>
Contact email, location line, photo registry	<code>web/src/lib/content.ts</code>
Page title, meta tags, JSON-LD, favicons	<code>web/index.html</code>
Terms & Conditions text	<code>web/src/pages/eleve/EleveTermsPage.tsx</code>
Photography files	<code>web/public/images/</code> + update <code>content.ts</code>
Favicons & icons	<code>web/public/favicon.*</code> , <code>icon.png</code>
Sitemap & robots	<code>web/public/sitemap.xml</code> , <code>robots.txt</code>

Image Handling

Three photos registered in `content.ts` : **marbleTable** (hero), **libraryBook**, **seatedPortrait**. Each ships AVIF + WebP + JPG with responsive `srcset` / `sizes` . When replacing an image, provide all format variants at the breakpoints listed in `public/images/` .

No FAQ section exists in the current codebase.

06

Design System

Élevé website visual language (not EMITZ doc branding)

Typography

- **Display:** Libre Baskerville (headings)
- **Body:** Inter 300–400 (UI & copy)
- Self-hosted woff2 in `public/fonts/`
- Configured in `index.html` + `tailwind.config.ts`

Breakpoints

- Mobile: default (<768px)
- Tablet: `md`: 768px
- Desktop: `lg`: 1024px

Visual Patterns

Sharp corners (`--radius: 0`), bronze hairline dividers (`.hairline`), film grain overlay (`.grain`), uppercase eyebrow labels (`.eyebrow`), animated link underlines (`.link-line`). Styles live in `src/index.css` and Tailwind utilities.

Colour Palette

<code>ivory</code>	#F6F1E9	Page background
<code>linen</code>	#FBF8F2	Alt sections
<code>espresso</code>	#2C2118	Primary text
<code>cocoa</code>	#59473A	Secondary text
<code>bronze</code>	#A6885B	Accents & rules

07

Motion & Integrations

Animation system & third-party services

Motion System — `components/site/motion.tsx`

COMPONENT	PURPOSE
<code>Reveal</code>	Fade-and-rise on scroll (below-fold sections)
<code>Lines</code>	Masked line-by-line heading reveal
<code>ParallaxImage</code>	Scroll-linked photo drift
<code>useSmoothScroll</code>	Lenis smooth scroll (disabled for reduced-motion)
<code>EleveMarquee</code>	72s infinite horizontal scroll strip

Performance note: Hero animations use transform-only motion (no opacity gating) so content paints immediately. Avoid adding opacity delays to above-the-fold elements.

Integrations

SERVICE	IMPLEMENTATION	CONFIGURABLE IN
Cal.com	Inline calendar · event <code>elevebychandni/fdc</code> · lazy-loaded on scroll	<code>EleveCalInline.tsx</code>
WhatsApp	Floating button → <code>wa.me/919319432700</code>	<code>EleveWhatsApp.tsx</code>
Google Analytics	Website traffic & analytics tracking	<code>index.html</code> , <code>App.tsx</code>

09

Hosting, Development & Deployment

Local setup through to production

Deployment Flow

Vercel config in root `vercel.json` : installs & builds from `web/` , outputs `web/dist/` , SPA rewrite to `index.html` . Non-www redirects to www.

Local Development

```
cd web
npm install          # install dependencies
npm run dev          # dev server → localhost:8080
npm run build        # production build → web/dist/
npm run preview      # preview production build
npm run lint         # ESLint check
```

Safe Deployment Workflow

1. Pull latest from `main`
2. `cd web && npm install` (if dependencies changed)
3. Make changes & test locally with `npm run dev`
4. Run `npm run build` — confirm no errors
5. Commit & push to `main`
6. Verify Vercel deployment succeeds
7. Check live site on desktop & mobile

Optimizations Implemented

- Hero: transform-only motion (no LCP-blocking opacity fades)
- GA: deferred script load after first paint / interaction
- Images: AVIF/WebP responsive srcset with accurate sizes
- Fonts: self-hosted woff2 with preload & font-display: swap
- Cal.com: lazy mount + preconnect warm-up on scroll approach
- Terms page: code-split (lazy-loaded route)

Known Limitation

Cal.com's hosted application (~2 MB, ~90 requests) remains the main bottleneck for the booking section. This is third-party weight outside our control. The warm-up strategy reduces perceived wait time but cannot eliminate it entirely.

Troubleshooting

ISSUE	CHECK	FIRST ACTION
Site not loading	Vercel dashboard, domain DNS	Check deployment status & domain settings
Build failure	Vercel build logs	Run <code>npm run build</code> locally to reproduce
Images missing	<code>public/images/</code> + <code>content.ts</code>	Verify file exists & path matches registry
Cal.com not loading	<code>EleveCalInline.tsx</code> , Cal.com dashboard	Verify event link & namespace are active
Styling broken	<code>index.css</code> , Tailwind classes	Check for typos; run build to catch errors
404 on routes	<code>vercel.json</code> rewrites	Ensure SPA rewrite to <code>/index.html</code> exists

SERVICE	PURPOSE	ACCESS METHOD
GitHub	Source code repository	Invite to org/repo — no credentials in this doc
Vercel	Hosting & deployment	Team invite via Vercel dashboard
Domain (GoDaddy)	elevebychandni.com DNS	Account access via domain registrar
Google Analytics	Traffic analytics	Property access via Google account
Google Search Console	Search indexing	Property access via Google account
Cal.com	Booking calendar management	Account access via Cal.com dashboard

Security: Access should be granted directly through each platform. Never store passwords, API keys, or tokens in this document or the codebase.

Developer Handover Checklist

- ☐ Repository access received
- ☐ Local dev environment configured (`npm install` + `npm run dev`)
- ☐ Production build tested (`npm run build`)
- ☐ Vercel deployment flow understood
- ☐ Domain & DNS configuration understood
- ☐ Content structure understood (`copy.ts` , `content.ts` , `tokens.ts`)
- ☐ Image/asset workflow understood
- ☐ Cal.com integration understood
- ☐ Analytics access confirmed
- ☐ Live website verified on desktop & mobile
- ☐ Maintenance & troubleshooting workflow understood
